1. What are varicose veins?
Varicose veins are enlarged, bulging veins usually found in the legs; they can cause uncomfortable symptoms such as swelling and aching. Common risk factors include family history, aging, being overweight or obese, and working at jobs requiring prolonged standing.

Varithena® (polidocanol injectable foam) does not treat all types and all symptoms of varicose veins.

2. What is Varithena®?
Varithena® (polidocanol injectable foam) is a prescription medicine used to treat varicose veins caused by problems with the great saphenous vein (GSV) and other related veins in the leg’s GSV system. Varithena® improves symptoms related to or caused by varicose veins, and the appearance of varicose veins.

Varithena® is administered by the doctor into the malfunctioning veins. The minimally invasive, non-surgical treatment doesn’t require incisions. The doctor usually numbs the injection site, but no additional anesthesia is required.

3. What results might I expect with Varithena®?
In clinical trials, Varithena® reduced patients’ varicose vein symptoms including heaviness, aching, swelling, throbbing, and itching (HASTI™ Symptoms). Varithena® also improved vein appearance in assessments by both patients and doctors.

4. How does Varithena® work?
Your doctor administers Varithena® through a catheter or by direct injection into your malfunctioning vein. The foam fills the desired section of the vein, and the diseased vein collapses. Blood flow shifts to healthier veins nearby.

5. What happens to Varithena® after it’s injected?
The foam is deactivated when it comes in contact with blood.

6. How long does treatment take?
It usually takes the doctor less than an hour to administer Varithena®, and you go home the same day.

7. Are there side effects to treatment with Varithena®?
The most common side effect seen with Varithena® is leg pain or discomfort. In the majority of cases, leg pain stops within one week.

The other most common side effects are injection site bruising or pain, and potentially serious blood clots in the leg veins. These are not all of the possible side effects of Varithena®. Tell your doctor about any side effect that bothers you or that does not go away.

8. How many treatments might I need?
You may see results with as little as one treatment, depending on the number and size of your varicose veins. Additional treatment may be necessary if the size and extent of the veins to be treated require more than the maximum dose of Varithena® per session. Treatment sessions are separated by a minimum of 5 days.

9. How soon can I get back to normal activities?
You may resume some activities the same day as treatment. You will need to keep your post-treatment bandages dry and in place for 48 hours and to wear compression stockings on your treated leg for 2 weeks.

You should avoid heavy exercise for one week. For a month, you should walk at least 10 minutes a day and avoid long periods of inactivity.

INDICATIONS
Varithena® (polidocanol injectable foam) is a prescription medicine used to treat varicose veins caused by problems with the great saphenous vein (GSV) and other related veins in the leg’s GSV system. Varithena® improves symptoms related to or caused by varicose veins, and the appearance of varicose veins.

IMPORTANT SAFETY INFORMATION
You should not be treated with Varithena® if you are allergic to polidocanol or have clots in your blood vessels.

See back side for additional safety information.

Varithena® (polidocanol injectable foam) is a prescription medicine used to treat varicose veins caused by problems with the great saphenous vein (GSV) and other related veins in the leg’s GSV system. Varithena® improves symptoms related to or caused by varicose veins, and the appearance of varicose veins.

IMPORTANT SAFETY INFORMATION
You should not be treated with Varithena® if you are allergic to polidocanol or have clots in your blood vessels. Severe allergic reactions have been reported in people treated with liquid forms of polidocanol and some patients have died from these reactions. Varithena® is a foam made from polidocanol. A healthcare professional will observe you for signs of allergic reactions for at least 10 minutes after you are treated with Varithena®.

Tell your doctor about all of your medical conditions, including if you
• have arterial disease (a disease of the blood vessels)
• have reduced mobility
• have a history of blood clots in the veins or lungs
• have had major surgery in the past 3 months
• have recently had a long hospital stay
• are pregnant or have recently been pregnant

The most common side effects seen with Varithena® are leg pain or discomfort, injection site bruising or pain, and potentially serious blood clots in the leg veins. These are not all of the possible side effects of Varithena®. Tell your healthcare provider about any side effect that bothers you or that does not go away. You can also report side effects to the FDA at 1-800-FDA-1088.

Varithena® is administered by your doctor. Doctors using Varithena® must be experienced in vein procedures and trained in using Varithena®.
